THE DIGITAL MARKETS ACT AT WORK:

BETTER INTEROPERABILITY WITH iOS & iPadOS

As its first enforcement action to support businesses and end users under the DMA, in March 2025, the Commission specified how Apple must make iOS and iPadOS more interoperable.

The Commission's actions will give device manufacturers and app developers **new** opportunities to bring innovative products to the market, offering a wider choice and a **better user experience** to iPhone and iPad users.

What is interoperability?

Connected devices, such as smartwatches, headphones or TVs, of all brands will benefit from better access to crucial iOS connectivity features.

Changes are coming **fast**: in iOS 26 (end of 2025) for some major features, and in 2026 for nearly all features.

The Commission requires Apple to improve iOS and make connected devices work better with iPhones, for example:

eatures for data transfers

Non-Apple virtual reality headsets can use Peer-to-peer Wi-Fi to transfer files or stream video faster and more reliably.

Features for interactivity

iPhone users can reply to iOS **notifications** on their non-Apple smartwatch or see rich content such as pictures.

Features for device set-up and configuration

iPhone users can use Proximity pairing to connect their non-Apple headphones more seamlessly by holding them near their iPhone.

For other iOS and iPadOS features, third parties can request Apple to implement additional interoperability. Apple gets clear rules to make this process more transparent and effective.

Developers will benefit from a fast and fair handling of their interoperability requests.

The Commission requires Apple to enhance the process of requesting interoperability:

better technical documentation

timely communication recourse for rejections

predictable timeline

public tracker and reporting

Make the most of interoperability

The DMA is bringing real change. Any iOS or iPadOS developer can seize the opportunities that these changes bring about.
